### ABSTRACT

Distributional patterns of the South American species of the freshwater amphipod genus *Hyalella* were analysed using a panbiogeographic approach. Five generalized tracks were found: (1) northern Andes to Lake Titicaca (*H. dielaii*, *H. meinerti*, *H. dybowskii*, *H. jelskii*, *H. lubominsky*, and *H. pauperocavae*; (2) lake Titicaca (*H. armata*, *H. cuprea*, *H. latinamus*, *H. lucifugax*, *H. montforti*, *H. neveulemairei*, *H. robusta*, *H. tiwanaku*, *H. simplex simplex*, and *H. solida*); (3) central Andes (*H. fossamancinii* and *H. kochii*); (4) Pampas (*H. bonariensis*, *H. caeca*, *H. castroi*, *H. longispina*, *H. montenegrinae*, *H. pampeana*, *H. pernix*, *H. pseudoazteca*, and *H. warmingii*); and (5) Subantarctic (*H. patagonica*, *H. costera*, *H. curvispina*, *H. chiloensis*, *H. falklandensis*, *H. franciscae*, *H. neonomia*, *H. patagonica*, and *H. simplex*). One node was found at lake Titicaca (intersection of generalized tracks 1, 2, and 3).

**KEYWORDS:** Chile, *Hyalella* South America, biogeography

### RESUMEN

Se estudió el patrón de distribución de especies Sudamericanas del género de anfípodo de agua dulce *Hyalella* mediante una aproximación panbiogeográfica. Se encontraron cinco trazos (1) Norte de los Andes al Lago Titicaca (*H. dielaii*, *H. meinerti*, *H. dybowskii*, *H. jelskii*, *H. lubominsky*, y *H. pauperocavae*; (2) Lago Titicaca (*H. armata*, *H. cuprea*, *H. latinamus*, *H. lucifugax*, *H. montforti*, *H. neveulemairei*, *H. robusta*, *H. tiwanaku*, *H. simplex simplex*, y *H. solida*); (3) Andes centrales (*H. fossamancinii* y *H. kochii*); (4) Pampas (*H. bonariensis*, *H. caeca*, *H. castroi*, *H. longispina*, *H. montenegrinae*, *H. pampeana*, *H. pernix*, *H. pseudoazteca*, y *H. warmingii*); y b (5) Subantártico (*H. araucana*, *H. costera*, *H. curvispina*, *H. chiloensis*, *H. falklandensis*, *H. franciscae*, *H. neonomia*, *H. patagonica*, y *H. simplex*). Se encontró un nodo en el lago Titicaca que correspondió a la intersección de los trazos 1; 2 y 3.

**PALABRAS CLAVE:** Chile, *Hyalella* Sudamérica, biogeografía

### INTRODUCTION

Freshwater amphipods inhabit superficial and underground waters. They have different trophic roles: herbivores, carnivores, detritivores or omnivores (Witt and Hebert 2000; Väinölä *et al.* 2008). In South America, amphipods are represented by species inhabiting subterranean (Bogidellidae) and superficial (Hyalellidae) waters (Väinölä *et al.* 2008). Hyalellidae are represented in the Americas by the genus *Hyalella*, which has been recently studied from

a taxonomic perspective (Witt and Hebert 2000; Witt *et al.* 2003; González and Watling 2002a-c, 2003a-c; González 2003; González *et al.* 2006), and is possibly found in New Zealand (Pugh *et al.* 2002).

Recent studies on Chilean species of *Hyalella* indicate that they inhabit subsaline inland waters, such as streams and shallow ponds in northern Chile (González 2003; De los Ríos *et al.* 2010), coastal inland waters (González 2003), and oligotrophic inland waters of Patagonia between 38-

51° S (González 2003; De los Ríos *et al.* 2007; De los Ríos and Roa 2010). Similar studies have investigated Central Argentina and Patagonia (Lopretto 1982, 1983a, b; Miserendino 2001; Jergentz *et al.* 2004; Miserendino *et al.* 2008; Zilli *et al.* 2008).

Integrative biogeographic studies of the species of *Hyalella* have not yet been conducted. Here we undertake a preliminary track analysis of the South American species of this genus to improve current understanding of their patterns of geographical distribution.

## MATERIAL AND METHODS

Distributional data for this study were obtained from the literature (Lopretto 1982, 1983a, b; Pereira, 1985, 1989, 2004; Pereira *et al.* 1985, 1989; Stock and Plavot 1991; Bond-Buckup and Araujo 1998; Casset *et al.* 2001; González and Coleman 2002; González and Wattling 2002a-c, 2003a-d; Carrera and Gunkel 2003; González 2003; Jergentz *et al.* 2004; Pereira 2004; Coleman & González, 2006; Galan & Herrera, 2006; González *et al.* 2006; Da Silva and Bond-Buckup 2008; Dos Santos *et al.* 2008; Dutra *et al.* 2008; Zilli *et al.* 2008; Rauque and Semenov 2009; Spaccesi & Rodríguez 2009; De los Ríos *et al.* 2007, 2010; De los Ríos and Roa 2010; Cardoso *et al.*, 2011; Bastos-Pereira & De Padua-Bueno, 2012). It was not considered the species names *H. curvispina cangallensis*, *H. aff. curvispina*, *H. thomseni*, *H. sapropelica* and *H. lalage* (Brehm-Lunz, 1928, 1935; Gonzalez & Wattling, 2003c; González *et al.*, 2006)

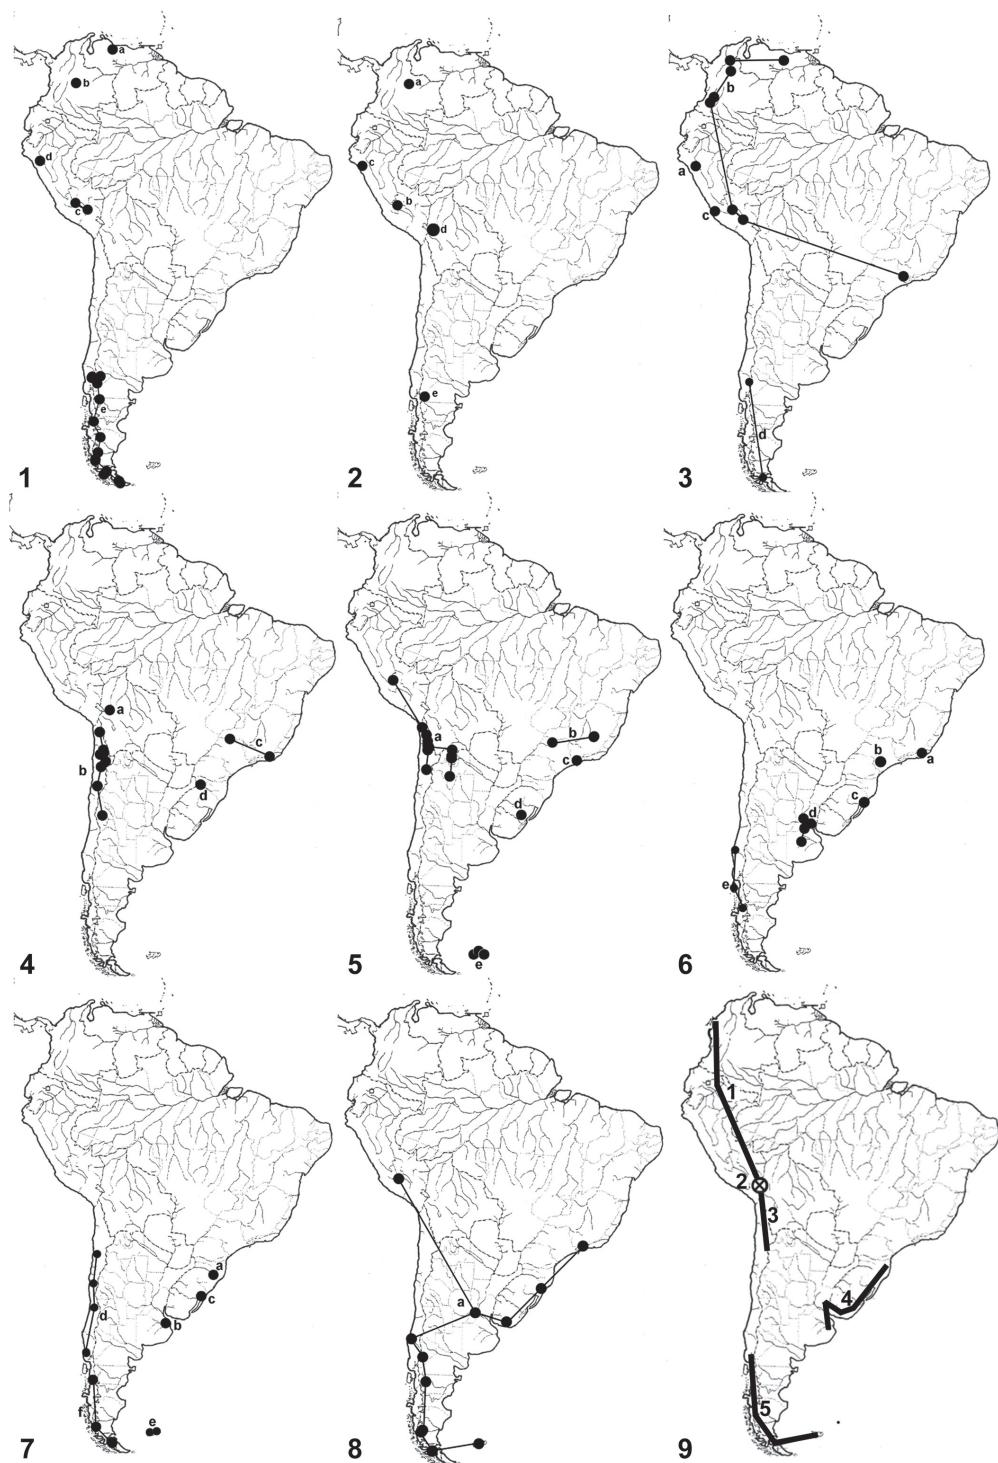

Coordinates of localities were obtained from the literature or calculated on maps and rounded to minutes. Within each country, localities are ordered roughly in a south-north direction. For details on the localities of each species see Appendix.

The panbiogeographic approach involves plotting distributions of different taxa on maps and joining their separate localities with lines called individual tracks. These tracks represent the geographical coordinates of species or higher taxa. Operationally, they consist of lines drawn on a map connecting the localities at which the taxa occur according to their geographical proximity. When different individual tracks are superimposed, the resulting summary lines are considered generalized tracks, which are interpreted as indicating the pre-existence of ancestral biotas that subsequently became fragmented by tectonic and/or climatic change. If two or more generalized tracks intersect in a given area, they determine a node, which indicates that different ancestral biotic and geological fragments interrelate in space and time as a consequence of terrain collision, docking or suturing. This node thus constitutes a

composite area. For further details about panbiogeographic methods, see Morrone (2004, 2006, 2009).

## RESULTS

Individual tracks and localities of the species analyzed are represented in figures 1-9. In northern South America, *H. anophthalma*, *H. azteca* and *H. inermis* has been reported from Venezuela (Fig. 1a) and *H. paramoensis* from northern Colombia (Fig. 1b). *Hyalella quindioensis* has been reported in inland mountain waters of the Colombian Andes (Fig. 2a). In the northern Andean inland waters, *H. simplex cangallensis* (Fig. 1c), *H. pauperocavae* (Fig. 2b), *H. lubomirskii* (Fig. 3a), *H. dybowskii* (Fig. 2c), and *H. meinerti* (Fig. 3b) have been reported. In coastal zones of Lake Titicaca (Peru and Bolivia), 17 species have been reported: *H. echinus*, *H. crawfordi*, *H. gauthieri*, *H. longipalma*, *H. neveulemairei*, *H. cuprea*, *H. nefrens*, *H. armata*, *H. lucifugax*, *H. montforti*, *H. tiwanaku*, *H. longipes*, *H. latimanus*, *H. robusta*, *H. longispina*, *H. solida*, and *H. jelskii* (Fig. 4a). *Hyalella fossamancinii* has been reported from inland waters of the Andes Argentina and northern Chile (Fig. 4b). *Hyalella kochi* occurs in Argentinean and Chilean mountain inland waters (Fig. 5a). Several species have been reported near the Atlantic coast: *H. gracilicornis* (Fig. 4c), *H. warmingi* (Fig. 5b), *H. pernix* (Fig. 5c), *H. spelaea*, *H. longistila* (Fig. 6a), *H. caeca* (Fig. 6b), and *H. dielaii* (Fig. 4d). The following species have been reported from southern Brazil: *H. carstica* (Fig. 2e), *H. longistila* (Fig. 2f), *H. pseudoazteca* (Fig. 5d), *H. montenegrinae* (Fig. 6c), *H. castroi* (Fig. 7a), and *H. pleoacuta* (Fig. 7c). Two species are restricted to streams from Buenos Aires province, Argentina: *H. bonariensis* (Fig. 6d) and *H. pampeana* (Fig. 7b). The species *H. costera* has been reported from coastal wetlands, streams, and shallow ponds from northern Chilean Patagonia to northern Chile, in the Antofagasta region (Fig. 7d). *Hyalella chiloensis* has been reported from Central Patagonia, coastal lakes in Chiloé Island, and Concepción in central Chile (Fig. 6e). *Hyalella falklandensis* (Fig. 7e) and *H. neonomia* (Fig. 5e) have been reported from the Falkland Islands (Islas Malvinas). In Patagonia, including nearby islands, *H. patagonica* has been reported (Fig. 1e). In Argentina, *H. curvispina* has been reported from southern, central and northern Argentinean Patagonia in large and deep lakes and in Buenos Aires province; it has also been reported from the Falkland Islands, Uruguay, southern Brazil specifically in coastal inland waters, and from Peru (Fig. 8a). *Hyalella rionegrina* has been reported from one locality in Chubut province, in Argentinean Patagonia (Fig. 2d). A species restricted to Chile is *H. simplex*, is known from southern Chilean Patagonia, specifically from coastal inland waters of the Strait of Magellan strait and from a high-mountain shallow lake in northern Chilean Patagonia

FIGURAS 1-8. Individual tracks: 1, *Hyalella anophtala*, *H. azteca*, *H. inermis* (a), *H. paramoensis* (b), *H. simplex cangallensis* (c), *Hyalella patagonica* (d); 2, *H. quindioensis* (a), *H. pauperocavae* (b), *H. dybowskii* (c), *H. rionegrina* (d); 3, *H. lubomirskii* (a), *H. meinerti* (b), *H. jelskii* (c), *H. simplex* (d); 4, *H. longipalma*, *H. neveulemairei*, *H. cuprea*, *H. nefrens*, *H. armata*, *H. lucifugax*, *H. montforti*, *H. tiwanaku*, *H. longipes*, *H. latimanus*, *H. robusta*, *H. longispina*, and *H. solida* (a), *H. fossamanchini* (b), *H. gracilicornis* (c), *H. dielaiii* (d); *H. carstica* (e); 5, *H. kochi* (a), *H. warmingi* (b), *H. pernix* (c), *H. pseudoazteca* (d), *H. neonoma* (e); *H. longistila* (6); 6, *H. longistila* (a), *H. caeca* (b), *H. montenegrinae* (c), *H. bonariensis* (d), *H. chiloensis* (e); 7, *H. castroi* (a), *H. pampeana* (b), *H. pleoacuta* (c), *H. costera* (d), *H. falklandensis* (e), *H. franciscae* (f); 8, *H. curvispina* (a). Fig. 9. Generalized tracks and nodes; 1, northern Andes generalized track; 2, lake Titicaca generalized track and node; 3, central Andes generalized track; 4, Pampas generalized track; 5, Subantarctic generalized track.

(Fig. 3d). *Hyalella franciscae* has been reported from lakes of Torres del Paine National Park, in the Magellan region (Fig. 7f).

Based on the overlap of the different individual tracks, we identified five generalized tracks (Fig. 9):

(1) Northern Andes. Inland waters of Venezuela and Peru between 10° N-15° S. The species assigned to this track are *H. anophtalma*, *H. inermis*, *H. quindioensis*, *H. paramoensis*, *H. meinerti*, *H. dybowskii*, *H. jelskii*, *H. lubominsky*, and *H. pauperocavae*.

(2) Lake Titicaca. The species assigned to this track are *H. armata*, *H. crawfordi*, *H. cuprea*, *H. echinus*, *H. gauthieri*, *H. latinamus*, *H. lucifugax*, *H. montforti*, *H. neveulemailei*, *H. robusta*, *H. tiwanaku*, *H. simplex simplex* and *H. solida*.

(3) Central Andes. Inland waters from central Argentina (31° S) to northern Chile (18-26° S). The species assigned to this track are *H. fossamancinii* and *H. kochi*.

(4) Pampas. Inland waters close to the Atlantic coast from Buenos Aires province (35° S) in central Argentina to Uruguay and southern Brazil (19° S). The species assigned to this track are *H. bonaeriensis*, *H. caeca*, *H. carstica*, *H. castroi*, *H. dielaii*, *H. longistila*, *H. montenegrinae*, *H. pampeana*, *H. pernix*, *H. pseudoazteca*, and *H. warmingii*.

(5) Subantarctic. Andean inland waters of Argentina and Chile between 39-51° S, southern Patagonian plains between 51-53° S, Tierra del Fuego, and the Falkland Islands. Species assigned to this track are *H. curvispina*, *H. chiloensis*, *H. falklandensis*, *H. franciscae*, *H. neonomia*, *H. patagonica*, and *H. simplex*.

One node (Fig. 9) was found where generalized tracks 1, 2, and 3 intersect, at lake Titicaca.

## DISCUSSION

The generalized tracks identified are similar to those described by Menu-Marque *et al.* (2000), who applied this procedure to the copepod genus *Boeckella*. That study identified a generalized track in southern Patagonia, the Atlantic coast of Argentina, the Andean mountains of northern Argentina and Chile, and the Andean regions of Bolivia, Colombia and Ecuador. Nevertheless, the nodes reported in the present study differ from those identified by Menu-Marque *et al.* (2000). Species of *Hyalella* are also known from Mexico and Central America, Bousfield (1996) supported it, and suggested the presence of *Astrohyalella* and *Mesohyalella* genus in South America. Nevertheless,

the recent literature mentioned the presence of *Hyalella* genus for all American continent (Väinöla *et al.*, 2008; Witt & Hebert 2000; Wit *et al.*, 2006)

The absence of nodes in southern Patagonia agrees with analyses for Subantarctic islands (Pugh *et al.* 2002) and southern South America (Dos Santos *et al.* 2008), about similarities between continental Subantarctic species. Our results contrast with those from calanoid copepods (Menu-Marque *et al.* 2000) and fishes of the genus *Galaxias* (Cussac *et al.* 2004), that are known from southern Patagonia, New Zealand and adjacent islands, a different situation was reported for species of *Hyalella* that are widespread in South North America (Witt & Hebert, 2000; Witt *et al.* 2003). The results of geographical distribution of *Hyalella* genus are similar in comparison to freshwater crabs of *Aegla* genus that is located in central and southern Argentina and Chile, and east South America, specifically Brazil and Uruguay (Pérez-Lozada *et al.*, 2002, 2004, 2009). Nevertheless, species reports for practically all South American inland waters are rather scarce, so future analyses may modify these results, specifically between 18-8° N, the Titicaca basin, and eastern South America.

## ACKNOWLEDGEMENTS

The present study was funded by projects DGI-CDA-2007-01 and MECESUP Project UCT 0804. The authors recognize the contributions of Luciano Parra to the preparation of the present manuscript.
